Subjects

Strongly correlated electron systems exhibit a wide variety of novel quantum phases at low temperatures. The common thread of all topics are the effects of interactions, frustration, and quantum mechanics on producing novel dynamical phenomena in a wide variety of condensed matter systems.

Speakers will present phenomenological analysis of experiments and progress made in the development of new theoretical and numerical tools.

Organizers:

Assa Auerbach (assa@physics.technion.ac.il),

Daniel Podolsky (podolsky@physics.technion.ac.il),

Netanel Lindner (lindner@physics.technion.ac.il)

Coordinator:

Liz Yodim (liz@physics.technion.ac.il)
