Preface

In the excitement and rapid pace of developments, writing pedagogical texts has low priority for most researchers. However, in transforming my lecture notes¹ into this book, I found a personal benefit: the organization of what I understand in a (hopefully simple) logical sequence. Very little in this text is my original contribution. Most of the knowledge was collected from the research literature. Some was acquired by conversations with colleagues; a kind of physics oral tradition passed between disciples of a similar faith.

For many years, diagrammatic perturbation theory has been the major theoretical tool for treating interactions in metals, semiconductors, itinerant magnets, and superconductors. It is in essence a weak coupling expansion about free quasiparticles. Many experimental discoveries during the last decade, including heavy fermions, fractional quantum Hall effect, high-temperature superconductivity, and quantum spin chains, are not readily accessible from the weak coupling point of view. Therefore, recent years have seen vigorous development of alternative, nonperturbative tools for handling *strong* electron–electron interactions.

I concentrate on two basic paradigms of strongly interacting (or constrained) quantum systems: the Hubbard model and the Heisenberg model. These models are vehicles for fundamental concepts, such as effective Hamiltonians, variational ground states, spontaneous symmetry breaking, and quantum disorder. In addition, they are used as test grounds for various nonperturbative approximation schemes that have found applications in diverse areas of theoretical physics.

The level of the text should be appropriate for a graduate student with some background in solid state physics (single electron theory) and familiarity with second quantization. The exercises vary in difficulty and complement the text with specific examples and corollaries. Some of the mathematical background material is relegated to the appendices.

I owe most to the relentless efforts of Maxim Raykin, Moshe Havilio and Ziad Musslimani, whose careful proofreading weeded out inconsistencies and helped clarify numerous points. I am also heavily indebted to Duncan Haldane, who introduced me to quantum magnetism, and to my friend

¹for a graduate course on Quantum Many Particle Systems given at Boston University and at the Technion during 1990–1993.

and colleague, Dan Arovas, who taught me about parent Hamiltonians, the single mode approximation, and many other things,² and for his critical comments. I am grateful for the support of the Alfred P. Sloan Foundation, which enabled me to complete this book.

Assa Auerbach

²including the use of *phantom daggers*.

Contents

Preface	vii
I Basic Models	1
1 Electron Interactions in Solids	3
1.1 Single Electron Theory	3
1.2 Fields and Interactions	4
1.3 Magnitude of Interactions in Metals	6
1.4 Effective Models	7
1.5 Exercises	8
2 Spin Exchange	11
2.1 Ferromagnetic Exchange	11
2.2 Antiferromagnetic Exchange	13
2.3 Superexchange	16
2.4 Exercises	19
3 The Hubbard Model and Its Descendants	21
3.1 Truncating the Interactions	22
3.2 At Large U : The t - J Model	25
3.3 The Negative- U Model	28
3.3.1 The Pseudo-spin Model and Superconductivity	30
3.4 Exercises	33
II Wave Functions and Correlations	37
4 Ground States of the Hubbard Model	39
4.1 Variational Magnetic States	40
4.2 Some Ground State Theorems	45
4.3 Exercises	48
5 Ground States of the Heisenberg Model	51
5.1 The Antiferromagnet	52
5.2 Half-Odd Integer Spin Chains	56

5.3	Exercises	59
6	Disorder in Low Dimensions	61
6.1	Spontaneously Broken Symmetry	61
6.2	Mermin and Wagner's Theorem	62
6.3	Quantum Disorder at $T = 0$	66
6.4	Exercises	68
7	Spin Representations	69
7.1	Holstein–Primakoff Bosons	69
7.2	Schwinger Bosons	70
7.2.1	Spin Rotations	72
7.3	Spin Coherent States	72
7.3.1	The θ Integrals	75
7.4	Exercises	75
8	Variational Wave Functions and Parent Hamiltonians	79
8.1	Valence Bond States	79
8.2	$S = \frac{1}{2}$ States	81
8.2.1	The Majumdar–Ghosh Hamiltonian	83
8.2.2	Square Lattice RVB States	84
8.3	Valence Bond Solids and AKLT Models	85
8.3.1	Correlations in Valence Bond Solids	87
8.4	Exercises	88
9	From Ground States to Excitations	93
9.1	The Single Mode Approximation	94
9.2	Goldstone Modes	95
9.3	The Haldane Gap and the SMA	96
III	Path Integral Approximations	99
10	The Spin Path Integral	101
10.1	Construction of the Path Integral	101
10.1.1	The Green's Function	105
10.2	The Large S Expansion	106
10.2.1	Semiclassical Dynamics	107
10.2.2	Semiclassical Spectrum	109
10.3	Exercises	110
11	Spin Wave Theory	113
11.1	Spin Waves: Path Integral Approach	113
11.1.1	The Ferromagnet	118
11.1.2	The Antiferromagnet	119
11.2	Spin Waves: Holstein–Primakoff Approach	120

11.2.1	The Ferromagnet	121
11.2.2	The Antiferromagnet	123
11.3	Exercises	126
12	The Continuum Approximation	129
12.1	Haldane's Mapping	130
12.2	The Continuum Hamiltonian	131
12.3	The Kinetic Term	133
12.4	Partition Function and Correlations	133
12.5	Exercises	136
13	Nonlinear Sigma Model: Weak Coupling	139
13.1	The Lattice Regularization	139
13.2	Weak Coupling Expansion	141
13.3	Poor Man's Renormalization	142
13.4	The β Function	147
13.5	Exercises	150
14	The Nonlinear Sigma Model: Large N	153
14.1	The CP^1 Formulation	153
14.2	CP^{N-1} Models at Large N	155
14.3	Exercises	157
15	Quantum Antiferromagnets: Continuum Results	159
15.1	One Dimension, the Θ Term	159
15.2	One Dimension, Integer Spins	162
15.3	Two Dimensions	163
16	$SU(N)$ Heisenberg Models	165
16.1	Ferromagnet, Schwinger Bosons	166
16.2	Antiferromagnet, Schwinger Bosons	167
16.3	Antiferromagnet, Constrained Fermions	168
16.4	The Generating Functional	169
16.5	The Hubbard–Stratonovich Transformation	171
16.6	Correlation Functions	172
17	The Large N Expansion	175
17.1	Fluctuations and Gauge Fields	176
17.2	$1/N$ Expansion Diagrams	178
17.3	Sum Rules	181
17.3.1	Absence of Charge Fluctuations	182
17.3.2	On-Site Spin Fluctuations	183
17.4	Exercises	186

18 Schwinger Bosons Mean Field Theory	187
18.1 The Case of the Ferromagnet	187
18.1.1 One Dimension	191
18.1.2 Two Dimensions	192
18.2 The Case of the Antiferromagnet	194
18.2.1 Long-Range Antiferromagnetic Order	198
18.2.2 One Dimension	200
18.2.3 Two Dimensions	201
18.3 Exercises	203
19 The Semiclassical Theory of the $t - J$ Model	205
19.1 Schwinger Bosons and Slave Fermions	206
19.2 Spin-Hole Coherent States	207
19.3 The Classical Theory: Small Polarons	211
19.4 Polaron Dynamics and Spin Tunneling	214
19.5 The $t' - J$ Model	218
19.5.1 Superconductivity?	220
19.6 Exercises	221
IV Mathematical Appendices	223
Appendix A	
Second Quantization	225
A.1 Fock States	225
A.2 Normal Bilinear Operators	226
A.3 Noninteracting Hamiltonians	227
A.4 Exercises	228
Appendix B	
Linear Response and Generating Functionals	231
B.1 Spin Response Function	231
B.2 Fluctuations and Dissipation	233
B.3 The Generating Functional	233
Appendix C	
Bose and Fermi Coherent States	237
C.1 Complex Integration	237
C.2 Grassmann Variables	237
C.3 Coherent States	239
C.4 Exercises	240
Appendix D	
Coherent State Path Integrals	241
D.1 Constructing the Path Integral	241
D.2 Normal Bilinear Hamiltonians	242
D.3 Matsubara Representation	244
D.4 Matsubara Sums	244

D.5 Exercises	246
Appendix E	
The Method of Steepest Descents	249
Index	253
