What classical computers cant do

Factoring

- Factoring: $35 = \underbrace{5 \times 7}_{primes}$
- Try 35/2 =?, 35/3 =?...
- # trials: \sqrt{N}
- Best known: $O\left(e^{n^{1/3}...}\right)$, $n = \log N$

with 230 digits2000 years on 2.2 GHz processor

RSA cryptosystem

It's not a bug, it's a feature

•
$$\underbrace{N}_{public} = \underbrace{p \times q}_{secret}$$

• *Ecryption* = *f*(*Message*, *N*)

• Message = g(Encryption, p, q)

イロト イヨト イヨト

RSA security

- *f*, *g* are known functions.
- Security rests on the presumed difficulty of factoring

Everybody uses RSA

All the time

Shor's algorithm

The potential disaster/Benefits

If a fast factoring algorithm is found

. . .

Bad	Good			
The evil guy read our mail	We read the mail of the evil guys			
The internet is insecure	The darknet is insecure			
Financial transaction insecure	Money laundering is difficult			
State records become public	State records become public			

. . .

< ∃ >

The quantum threat

Shor algorithm

- Peter Shor 1994
- Fast factoring
- Time = $O((\# digits)^2)$
- Needs a quantum computer

Quantum computer

Allows for fast factoring

 <th</th>

 </

Science begets knowledge, opinion ignorance

Factoring Oracle

Weak and unreliable is good enough

Verify answer on a classical computer

- If incorrect, query again
- 10 trials will give p w.h.p.

JA (Technion)

Shor's algorithm

October 14, 2020 8/18

Math Preliminaries

Facts from number theory

poll 2

- *a^k* mod *N* is a periodic function of *k*
- Example with a = 2, N = 15 where period=4

k	1	2	3	4	5	 15
2 ^k Mod 15	2	4	8	16=1	2	 8

• Euler-Fermat: $a^{(p-1)(q-1)} = 1 \mod N$, gcd(a, N) = 1

Factoring reduces to finding the period of a^k mod N
pq = N
(p − 1)(q − 1) = Integer × period (a^k mod N) Number theory then gives p, q

JA (Technion)

Shor's algorithm

More math preliminaries

Fourier transform and its Discrete cousin

•
$$\tilde{F}(f) = \frac{1}{\sqrt{2\pi}} \int e^{ift} F(t) dt$$

• $e^{i\omega t} \Longrightarrow \delta(f - \omega)$
• Unitary
Discrete Fourier: $\omega = e^{2\pi i/L}$
root of unity
 $\tilde{F}(m) = \frac{1}{\sqrt{L}} \sum_{k=1}^{L} \omega^{km} F(k)$
poll 3

Periodic functions

Fourier transform is sparse

JA (Technion)

October 14, 2020 11/18

Functions contain exponential amount of information Hard classically

$\{F\}$ can be stored in 2n qubits

The superposition advantage

- *n* qubits encode one *k*
- k takes $N = 2^n$ values
- Superpositions: No extra qubits
- *n* qubits encode all of {*F*(*k*)}

 $\frac{|0\rangle + |1\rangle}{\sqrt{2}} |0\rangle \xrightarrow{\text{Function gate}} \frac{|0\rangle |F(0)\rangle + |1\rangle |F(1)\rangle}{\sqrt{2}}$

・ロト ・ 理 ト ・ ヨ ト ・ ヨ ト … ヨ

No free-lunch principle

Measurement reveals one random F(k)

Measurement reveals

• one, random, entry k and the corresponding F(k)

Shor algorithm

Quantum Fourier: Exponential improvement on FFT

Under the hood: massive superposition

$$\underbrace{|0\ldots0\rangle}_{argument \ function} \underbrace{|a^{0}\rangle}_{+\cdots+|1\ldots1\rangle|a^{L-1}\rangle}$$

- Measure function register $|a^k\rangle$
- Get: Random integer, e.g. $|a^k\rangle = |2\rangle$
- Argument register: superposition of pre-images of |2>

 $|1\rangle + |1+4\rangle + |1+2\times 4\rangle + |1+3\times 4\rangle$, $2^{1+4n} = 2 \mod 15$

Entanglement gives a periodic sequence of integers

Fourier=interference extract the period

You also need to be lucky

1 and N are trivial factors

- Bad luck: Measure $|0\rangle$
- Learn nothing:
 0 × period = integer × L

2 ^k Mod 15	1	2	4	8	1	2	
m	0	1	2	3	4	5	
<i>Fourier</i> ²	1	0	0	0	1		0

October 14, 2020 17/18

Moral: Store information in states not in amplitudes Be wise and modest

Fourier constructively interferes the periods on few basis states

- States=Integers: Revealed in single shot
- Amplitudes=Complex numbers: Revealed in statistics
- Relevant information is best revealed in one shot
- The amplitudes are the roulette in the quantum casino
